

CONTRACEPTIVE METHODS USING BENZIMIDAZOLONES

CROSS REFERENCE TO RELATED APPLICATIONS

This application is a divisional of US Patent Application No. 09/552,355, filed
5 April 19, 2000, which claims the benefit of the priority of US Provisional Patent
Application No. 60/198,249, filed May 4, 1999, now abandoned.

BACKGROUND OF THE INVENTION

This invention relates to regimens of administering compounds which are
10 antagonists of the progesterone receptor.

Intracellular receptors (IR) form a class of structurally related gene regulators
known as "ligand dependent transcription factors" (R. M. Evans, *Science*, **240**, 889,
1988). The steroid receptor family is a subset of the IR family, including progesterone
receptor (PR), estrogen receptor (ER), androgen receptor (AR), glucocorticoid
15 receptor (GR), and mineralocorticoid receptor (MR).

The natural hormone, or ligand, for the PR is the steroid progesterone, but
synthetic compounds, such as medroxyprogesterone acetate or levonorgestrel, have
been made which also serve as ligands. Once a ligand is present in the fluid
surrounding a cell, it passes through the membrane *via* passive diffusion, and binds to
20 the IR to create a receptor/ligand complex. This complex binds to specific gene
promoters present in the cell's DNA. Once bound to the DNA the complex modulates
the production of mRNA and protein encoded by that gene.

A compound that binds to an IR and mimics the action of the natural hormone
is termed an agonist, whilst a compound which inhibits the effect of the hormone is an
25 antagonist.

PR agonists (natural and synthetic) are known to play an important role in the
health of women. PR agonists are used in birth control formulations, typically in the
presence of an ER agonist. ER agonists are used to treat the symptoms of menopause,
but have been associated with a proliferative effect on the uterus which can lead to an

00270

increased risk of uterine cancers. Co-administration of a PR agonist reduces/ablates that risk.

PR antagonists may also be used in contraception. In this context they may be administered alone (Ulmann, et al, *Ann. N.Y. Acad. Sci.*, **261**, 248, 1995), in
5 combination with a PR agonist (Kekkonen, et al, *Fertility and Sterility*, **60**, 610, 1993) or in combination with a partial ER antagonist such as tamoxifen (WO 96/19997 A1 July 4, 1996). PR antagonists may also be useful for the treatment of hormone dependent breast cancers (Horwitz, et al, *Horm. Cancer*, 283, pub: Birkhaeuser, Boston, Mass., ed. Vedeckis) as well as uterine and ovarian cancers. PR antagonists
10 may also be useful for the treatment of non-malignant chronic conditions such as fibroids (Murphy, et al, *J. Clin. Endo. Metab.*, **76**, 513, 1993) and endometriosis (Kettel, et al, *Fertility and Sterility*, **56**, 402, 1991). PR antagonists may also be useful in hormone replacement therapy for post menopausal patients in combination with a
15 partial ER antagonist such as tamoxifen (U.S. Patent No. 5,719,136). PR antagonists, such as mifepristone and onapristone, have been shown to be effective in a model of hormone dependent prostate cancer, which may indicate their utility in the treatment of this condition in men (Michna, et al, *Ann. N.Y. Acad. Sci.*, **761**, 224, 1995).

U.S. Patent No. 5,521,166 (Grubb) teaches cyclophasic hormonal regimens comprising an antiprogesterin and a progestin wherein the progestin is administered in the alternating presence and absence of an antiprogesterin. The disclosed regimens also provide for use of an estrogen for a period of from 2-4 days to prevent breakthrough bleeding.

10

DESCRIPTION OF THE INVENTION

This invention provides combination therapies and dosing regimens utilizing antiprogestational agents in combination with one or more progestational agents. This invention further provides methods of treatment and dosing regimens further utilizing
5 in combination with these antiprogestins and progestins, an estrogen, such as ethinyl estradiol.

These regimens and combinations may be administered to a mammal to induce contraception or for the treatment and/or prevention of secondary amenorrhea, dysfunctional bleeding, uterine leiomyomata, endometriosis; polycystic ovary
10 syndrome, carcinomas and adenocarcinomas of the endometrium, ovary, breast, colon, prostate. Additional uses of the invention include stimulation of food intake. The uses herein for the treatment and/or prevention of the conditions or diseases described above includes the continuous administration or periodic discontinuation of
15 administration of the invention to allow for minimization of effect dose or minimization of side effects or cyclic menstrual bleeding.

The use of this invention for contraception includes administration, preferably orally, to a female of child bearing age an antiprogestin in combination with an estrogen or progestin or both. These administration regimens are preferably carried
20 out over 28 consecutive days, with a terminal portion of the cycle containing administration of no progestins, estrogens or anti-progestins.

The progestins of these combinations may be administered alone or in combination with an estrogen for the first 14 to 24 days of the cycle, the progestins being administered at a dosage range equal in progestational activity to about 35 μg to about 150 μg levonorgestrel per day, preferably equal in activity to from about 35 μg
25 to about 100 μg levonorgestrel per day. An antiprogestin may then be administered alone or in combination with an estrogen for a period of 1 to 11 days to begin on any cycle day between day 14 and 24. The anti-progestin in these combinations may be administered at a dose of from about 2 μg to about 50 μg per day and the estrogen may be administered at a dose of from about 10 μg to about 35 μg per day. In an oral

administration, a package or kit containing 28 tablets will include a placebo tablet on those days when the antiprogestin or progestin or estrogen is not administered.

- In a preferred embodiment of this invention, the progestins of this invention may be administered alone or in combination with estrogen for the initial 18 to 21 days of a 28-day cycle, followed by administration of an antiprogestin, alone or in combination with an estrogen, for from 1 to 7 days.

The estrogen to be used in the combinations and formulations of this invention is preferably ethinyl estradiol.

- Progestational agents useful with this invention include, but are not limited to, levonorgestrel, norgestrel, desogestrel, 3-ketodesogestrel, norethindrone, gestodene, norethindrone acetate, norgestimate, osaterone, cyproterone acetate, trimegestone, dienogest, drospirenone, nomegestrol, or (17-deacetyl)norgestimate. Among the preferred progestins for use in the combinations of this invention are levonorgestrel, gestodene and trimegestone.

- Examples of orally administered regimens of this invention over a 28 day cycle include administration of a progestational agent solely for the first 21 days at a daily dose equal in progestational activity to from about 35 to about 100 μ g of levonorgestrel. An antiprogestin compound of this invention may then be administered at a daily dose of from about 2 to 50 mg from day 22 to day 24, followed by no administration or administration of a placebo for days 25 to 28. It is most preferred that the daily dosages of each relevant active ingredient be incorporated into a combined, single daily dosage unit, totaling 28 daily units per 28-day cycle.

- In another regimen, a progestational agent may be coadministered for the first 21 days at a daily dose equal in progestational activity to from about 35 to about 150 μ g levonorgestrel, preferably equal in activity to from about 35 to about 100 μ g levonorgestrel, with an estrogen, such as ethinyl estradiol, at a daily dose range of from about 10 to about 35 μ g. This may be followed as described above with an antiprogestin administered at a daily dose of from about 2 to 50 mg from day 22 to day 24, followed by no administration or administration of a placebo for days 25 to 28.

Still another regimen within the scope of this invention will include coadministration from days 1 to 21 of a progestational agent, the progestational agent, preferably levonorgestrel, being administered at a daily dose equal in progestational activity to from about 35 to about 100 μg levonorgestrel, and an estrogen, such as ethinyl estradiol, at a daily dose range of from about 10 to about 35 μg . This will be followed on days 22 to 24 by coadministration of an antiprogesterin (2 to 50 mg/day) and an estrogen, such as ethinyl estradiol, at a daily dose of from about 10 to about 35 μg . From day 25 to day 28, this regimen may be followed by no administration or administration of a placebo.

This invention also kits or packages of pharmaceutical formulations designed for use in the regimens described herein. These kits are preferably designed for daily oral administration over a 28-day cycle, preferably for one oral administration per day, and organized so as to indicate a single oral formulation or combination of oral formulations to be taken on each day of the 28-day cycle. Preferably each kit will include oral tablets to be taken on each the days specified, preferably one oral tablet will contain each of the combined daily dosages indicated.

According to the regimens described above, one 28-day kit may comprise:

- a) an initial phase of from 14 to 21 daily dosage units of a progestational agent equal in progestational activity to about 35 to about 150 μg levonorgestrel, preferably equal in progestational activity to about 35 to about 100 μg levonorgestrel;
- b) a second phase of from 1 to 11 daily dosage units of an antiprogesterin compound of this invention, each daily dosage unit containing an antiprogesterin compound at a daily dosage of from about 2 to 50 mg; and
- c) optionally, a third phase of an orally and pharmaceutically acceptable placebo for the remaining days of the cycle in which no antiprogesterin, progestin or estrogen is administered.

A preferred embodiment of this kit may comprise:

a) an initial phase of 21 daily dosage units of a progestational agent equal in progestational activity to about 35 to about 150 μg levonorgestrel, preferably equal in progestational activity to about 35 to about 100 μg levonorgestrel;

5 b) a second phase of 3 daily dosage units for days 22 to 24 of an antiprogesterin compound of this invention, each daily dosage unit containing an antiprogesterin compound at a daily dosage of from about 2 to 50 mg; and

c) optionally, a third phase of 4 daily units of an orally and pharmaceutically acceptable placebo for each of days 25 to 28.

10 Another 28-day cycle packaging regimen or kit of this invention comprises:

a) a first phase of from 18 to 21 daily dosage units of a progestational agent equal in progestational activity to about 35 to about 150 μg levonorgestrel, preferably equal in activity to from about 35 to about 100 μg levonorgestrel, and, as an estrogen, ethinyl estradiol at a daily dose range of from about 10 to about 35 μg ; and

15 b) a second phase of from 1 to 7 daily dosage units of an antiprogesterin of this invention at a daily dose of from about 2 to 50 mg; and

c) optionally, an orally and pharmaceutically acceptable placebo for each of the remaining 0-9 days in the 28-day cycle in which no progestational agent, estrogen or antiprogesterin is administered.

20 A preferred embodiment of the kit described above may comprise:

a) a first phase of 21 daily dosage units of a progestational agent equal in progestational activity to about 35 to about 150 μg levonorgestrel, preferably equal in activity to from about 35 to about 100 μg levonorgestrel, and, as an estrogen, ethinyl estradiol at a daily dose range of from about 10 to about 35 μg ; and

25 b) a second phase of 3 daily dosage units for days 22 to 24 of an antiprogesterin administered at a daily dose of from about 2 to 50 mg; and

c) optionally, a third phase of 4 daily dose units of an orally and pharmaceutically acceptable placebo for each of days 25 to 28.

A further 28-day packaged regimen or kit of this invention comprises:

- a) a first phase of from 18 to 21 daily dosage units, each containing a progestational agent of this invention at a daily dose equal in progestational activity to about 35 to about 150 μ g levonorgestrel, preferably equal in activity to from about 35 to about 100 μ g levonorgestrel, and ethinyl estradiol at a daily dose range of from about 10 to about 35 μ g;
- b) a second phase of from 1 to 7 daily dose units, each daily dose unit containing an antiprogestin of this invention at a concentration of from 2 to 50 mg; and ethinyl estradiol at a concentration of from about 10 to about 35 μ g; and
- 10 c) optionally, an orally and pharmaceutically acceptable placebo for each of the remaining 0-9 days in the 28-day cycle in which no progestational agent, estrogen or antiprogestin is administered.

A preferred embodiment of the package or kit just described comprises:

- a) a first phase of 21 daily dosage units, each containing a progestational agent of this invention at a daily dose equal in progestational activity to about 35 to about 150 μ g levonorgestrel, preferably from about 35 to about 100 μ g levonorgestrel, and ethinyl estradiol at a daily dose range of from about 10 to about 35 μ g;
- 15 b) a second phase of 3 daily dose units for days 22 to 24, each dose unit containing an antiprogestin of this invention at a concentration of from 2 to 50 mg; and ethinyl estradiol at a concentration of from about 10 to about 35 μ g; and
- 20 c) optionally, a third phase of 4 daily units of an orally and pharmaceutically acceptable placebo for each of days 25 to 28.

25 In each of the regimens and kits just described, it is preferred that the daily dosage of each pharmaceutically active component of the regimen remain fixed in each particular phase in which it is administered. It is also understood that the daily dose units described are to be administered in the order described, with the first phase followed in order by the second and third phases. To help facilitate compliance with each regimen, it is also preferred that the kits contain the placebo described for the

final days of the cycle. It is further preferred that each package or kit comprise a pharmaceutically acceptable package having indicators for each day of the 28-day cycle, such as a labeled blister package or dial dispenser packages known in the art.

- 5 In this disclosure, the terms anti-progestational agents, anti-progestins and progesterone receptor antagonists are understood to be synonymous. Similarly, progestins, progestational agents and progesterone receptor agonists are understood to refer to compounds of the same activity.

- 10 These dosage regimens may be adjusted to provide the optimal therapeutic response. For example, several divided doses of each component may be administered daily or the dose may be proportionally increased or reduced as indicated by the exigencies of the therapeutic situation. In the descriptions herein, reference to a daily dosage unit may also include divided units which are administered over the course of each day of the cycle contemplated.

- 15 Compounds of this invention which may be used as the anti-progestational agents in the kits, methods and regimens herein are those of the Formula I:

The anti-progestational compounds of this invention may contain an asymmetric carbon atom and some of the compounds of this invention may contain one or more asymmetric centers and may thus give rise to optical isomers and diastereomers. While shown without respect to stereochemistry in Formula I, II, and 5 III, the present invention includes such optical isomers and diastereomers of these compounds; as well as the racemic and resolved, enantiomerically pure R and S stereoisomers; as well as other mixtures of the R and S stereoisomers and pharmaceutically acceptable salts thereof.

The term "alkyl" is used herein to refer to both straight- and branched-chain 10 saturated aliphatic hydrocarbon groups having one to eight carbon atoms, preferably one to six carbon atoms; "alkenyl" is intended to include both straight- and branched-chain alkyl group with at least one carbon-carbon double bond and two to eight carbon atoms, preferably two to six carbon atoms; "alkynyl" group is intended to cover both 15 straight- and branched-chain alkyl group with at least one carbon-carbon triple bond and two to eight carbon atoms, preferably two to six carbon atoms.

The terms "substituted alkyl", "substituted alkenyl", and "substituted alkynyl" refer to an alkyl, alkenyl, and alkynyl as just described having one or more substituents from the group including halogen, CN, OH, NO₂, amino, aryl, heterocyclic, substituted 20 aryl, substituted heterocyclic, alkoxy, aryloxy, substituted alkoxy, alkylcarbonyl, alkylcarboxy, alkylamino, arylthio. These substituents may be attached to any carbon of alkyl, alkenyl, or alkynyl group provided that the attachment constitutes a stable chemical moiety.

The term "aryl" is used herein to refer to an aromatic system which may be a single ring or multiple aromatic rings fused or linked together as such that at least one 25 part of the fused or linked rings forms the conjugated aromatic system. The aryl groups include but are not limited to phenyl, naphthyl, biphenyl, anthryl, tetrahydronaphthyl, and phenanthryl. The term "substituted aryl" refers to aryl as just defined having one to four substituents from the group including halogen, CN, OH, NO₂, amino, alkyl, cycloalkyl, alkenyl, alkynyl, alkoxy, aryloxy, substituted alkoxy,

alkylcarbonyl, alkylcarboxy, alkylamino, or arylthio. The term "heterocyclic" is used herein to describe a stable 4- to 7-membered monocyclic or a stable multicyclic heterocyclic ring which is saturated, partially unsaturated, or unsaturated, and which consists of carbon atoms and from one to four heteroatoms selected from the group including N, O, and S atoms. The N and S atoms may be oxidized. The heterocyclic ring also includes any multicyclic ring in which any of above defined heterocyclic rings is fused to an aryl ring. The heterocyclic ring may be attached at any heteroatom or carbon atom provided the resultant structure is chemically stable. Such heterocyclic groups include, for example, tetrahydrofuran, piperidinyl, piperazinyl, 2-oxopiperidinyl, azepinyl, pyrrolidinyl, imidazolyl, pyridyl, pyrazinyl, pyrimidinyl, pyridazinyl, oxazolyl, isoxazolyl, morpholinyl, indolyl, quinolinyl, thienyl, furyl, benzofuranyl, benzothienyl, thiamorpholinyl, thiamorpholinyl sulfoxide, and isoquinolinyl. The term "substituted heterocyclic" is used herein to describe the heterocyclic just defined having one to four substituents selected from the group which includes halogen, CN, OH, NO₂, amino, alkyl, substituted alkyl, cycloalkyl, alkenyl, substituted alkenyl, alkynyl, alkoxy, aryloxy, substituted alkyloxy, alkylcarbonyl, alkylcarboxy, alkylamino, or arylthio.

The term "alkoxy" is used herein to refer to the OR group, where R is alkyl or substituted alkyl. The term "aryloxy" is used herein to refer to the OR group, where R is aryl or substituted aryl. The term "alkylcarbonyl" is used herein to refer to the RCO group, where R is alkyl or substituted alkyl. The term "alkylcarboxy" is used herein to refer to the COOR group, where R is alkyl or substituted alkyl. The term "aminoalkyl" refers to both secondary and tertiary amines wherein the alkyl or substituted alkyl groups, containing one to eight carbon atoms, which may be either same or different and the point of attachment is on the nitrogen atom. The term "halogen" refers to Cl, Br, F, or I.

The anti-progestin compounds of the present invention can be prepared as described in the following schemes:

5

As illustrated in Scheme I, these compounds are generally prepared by employing the suitable coupling reaction as a final step and further converted to the thiourea analogues. Thus, an appropriately protected benzoimidazolinones **1** (numerous protecting groups including but not limited to alkoxycarbonyl such as BOC group can be employed in the starting material **1**) readily prepared according to the procedure of Meanwell et al. (*J. Org. Chem.* **60**, 1565-1582(1995)) can be

10

alkylated at position-3 under a number of conditions. Among the reaction protocols, compound 1 can be alkylated by treatment of 1 with a suitable base such as sodium hydride in an appropriate nonprotic solvent such as DMF followed by addition of an alkylating agent such as alkyl iodide or triflate. Alternatively, the compound 2 can be effected employing a Mitsunobu protocol. The conventional Mitsunobu reaction can couple the compound 1 with an appropriate alcohol using a phosphorous reagent such as triphenyl phosphine and a dehydrating agent such as DEAD (diethyl azodicarboxylate) in a suitable solvent such as THF at the temperature ranging from 0°C to the boiling point of the solvent which was employed. Deprotection of compound 2 to give 3 can be furnished via numerous conditions such as acidic deprotection using an acid such as neat trifluoroacetic acid or basic deprotection employing a base such as sodium alkoxide in a suitable solvent such as THF or alcohol at temperature ranging from ambient temperature to the boiling point of the solvent employed. The compounds of this invention, 4, can be readily prepared by employing various coupling reactions including Suzuki, Stille protocols. These reactions are commonly performed in the presence of transition metallic catalyst, e.g., palladium or nickel complex often with phosphino ligands, e.g., Ph_3P , 1,1'-bis(diphenylphosphino)ferrocene, 1,2-bis(diphenylphosphino)ethane or a catalyst such as palladium acetate. Under this catalytic condition, an appropriately substituted nucleophilic reagent, e.g., aryl boronic acid, arylstannane, or aryl zinc compound, is coupled with bromobenzoimidazolinones 3 to give compounds 4. An appropriate base is often needed in the reaction; the commonly used bases include but not limited to sodium bicarbonate, sodium carbonate, potassium phosphate, barium carbonate, cesium fluoride, or potassium acetate. The most commonly used solvents in these reactions include benzene, DMF, isopropanol, ethanol, DME, ether, acetone or a mixture of above solvent and water. The coupling reaction is generally executed under an inert atmosphere such as nitrogen or argon at temperatures ranging from room temperature to 95 °C.

The anti-progestin compounds of this invention, **5**, can be easily prepared using an appropriate sulfur reagent such as Lawesson's reagent or P_2S_5 in a suitable solvent such as toluene, xylene, chlorobenzene at reflux under an inert atmosphere such as nitrogen or argon.

Scheme II

Scheme III

As shown in Scheme II, 5-aryl benzothiazolinones **7** can be readily effected from an appropriate 5-bromo-benzothiazolinone **6** and a suitable electrophile such as an aryl boronic acid, aryl tin reagent, or aryl zinc reagent *via* a suitable coupling reaction as described for the synthesis of benzimidazolinones **4**. Conversion of **7b** into **7a** can be effected using an appropriate sulfur reagent such as Lawesson's reagent or P_2S_5 in a suitable solvent such as toluene, xylene, chlorobenzene at reflux under an inert atmosphere such as nitrogen or argon.

The synthetic approaches leading to the 5-aryl benzoxazolinones **11** are described in scheme III. As illustrated in scheme III, an appropriately substituted bromo *o*-anisidine can be coupled with an appropriate electrophile such as aryl boronic acid or aryl tin reagent *via* a coupling reaction as described for the synthesis of

compounds **4** to give the biaryl **9**. Demethylation of biaryl **9** to give amino phenol **10** can be furnished *via* various conditions including treatment of **9** with strong Lewis acid such as boron tribromide in a suitable solvent such as methylene chloride or treatment of **9** with a mixture of a suitable Lewis acid such as aluminum chloride and a soft nucleophile such as thiol in a suitable solvent such as methylene chloride under an inert atmosphere such as argon or nitrogen. Ring closure of amino phenol **10** to produce the compounds of this invention **11** can be effected by using an appropriate condensing agent such as carbonyldiimidazole, phosgene, dimethylcarbonate, or diethylcarbonate in a suitable nonprotic solvent such as THF at temperatures ranging from room temperature to 65 °C. Conversion of **11** into **11a** can be accomplished using an appropriate sulfur reagent such as Lawesson's reagent or P₂S₅ in a suitable solvent such as toluene, xylene, chlorobenzene at reflux under an inert atmosphere such as nitrogen or argon.

Schemes IV, V, and VI describe the synthesis of other 5-aryl benzoimidazolinone, 5-aryl benzothiazolinone, 5-aryl benzoxazolinone bioisosteres. Using a similar procedure reported by Kondo et al. (Kondo, et al. *J. Med. Chem.* **33**(7), 2012-2015(1990)) compound **12**, **15**, or **18** can be effected by treatment of compound **10**, **14**, or **17** with an appropriate ketene-S, S-acetals (at least one of R₂ or R₃ is an electron withdrawing group.) in a suitable solvent such as toluene or anhydrous ethanol under an inert atmosphere such as nitrogen or argon at reflux. In a similar fashion, compound **13**, **16**, or **19** can be accomplished by reaction of compound **10**, **14**, or **17** with an appropriate imino-S, S-acetals or imino-acetals (R₂ is an electron withdrawing group.) employing a procedure similar to that of Evers, et al. (Evers, et al. *I. Prakt. Chem.* **333**(5), 699-710 (1991)) or Haake et al. (Haake et al. *Synthesis-Stuttgart* **9**, 753-758 (1991)) in a suitable solvent such as ethanol under an inert atmosphere such as argon or nitrogen at reflux.

Scheme IV

Compounds **14** and **17** can be prepared as shown in schemes V and VI from compound **4** and **7** using a strong basic condition such as heating the compound in a mixture of potassium hydroxide and ethylene glycol at 165°C under an inert atmosphere such as argon or nitrogen.

Scheme V

Scheme VI

As illustrated in Scheme VII, the compounds of this invention can be further derivatized at position-1 via numerous approaches leading to a variety of the novel derivatives including 20, 21, and 22. Thus, alkyl or substituted alkyl derivatives 20 can be effected by treatment of compound A with a suitable base such as sodium hydride in suitable solvent such as DMF under an inert atmosphere such as argon or nitrogen followed by addition of an appropriate electrophile such as alkyl or substituted alkyl bromide, iodide, or triflate. Such transformation of A at position-1 can also be effected using a biphasic condition as indicated in Scheme VII in which alkylation is executed using a biphasic catalyst such as tributylammonium bromide in a suitable solvent such as acetonitrile. A further example of such modification includes, but is not limited to, the one depicted in Scheme VIII in that heating of A with triethyl orthoformate affords 1-substituted derivatives 20.

Scheme VII

- The acylation or carboxylation of the compound **A** at position-1 to give compound **21** can be readily effected by treatment of **A** with a suitable acylating or carboxylating reagent such as di-*t*-butyl dicarbonate in the presence of a suitable basic catalyst such as DMAP in a suitable solvent such as acetonitrile under an inert atmosphere such as argon or nitrogen. The amination of position-1 of compound **A** to give compound **22** can be furnished using a suitable aminating reagent such as chloroamine in the presence of a suitable base such as sodium hydride in a suitable solvent such as THF or diethyl ether following the literature procedure (Metlesics et al. *J. Org. Chem.* **30**, 1311(1965)).

Scheme VIII

Scheme VIII describes a procedure to prepare quinoxalin-4-ones. An appropriately *o*-fluoro nitro-benzene **23** (X = I, Br, Cl) is reacted with an appropriately substituted amino acid derivatives in the presence of a suitable base in a protic solvent such as alcohol to give compound **24** which is readily reduced by a suitable reducing agent such as tin chloride to furnish quinoxalin-2-one **25**. The anti-progestational compounds of this invention, **26**, can be easily effected by coupling an appropriate aryl boronic acid with compound **25** in a similar fashion as for the preparation of compound **9**. Conversion of **26** to **27** can be readily effected following the procedure of compound **11a**.

Scheme IX

Scheme IX illustrates an approach to prepare the benzothiazinones. Thus, an appropriately substituted *o*-amino benzenethiol **28** is treated with an appropriately substituted α -bromoacetate in a suitable solvent such as ethanol to afford compound **29** which can be readily coupled with an appropriate aryl boronic acid following the protocol of compound **9** to afford the compounds of this invention, **30**. Conversion of **30** to **31** can be carried out using a suitable sulfur reagent such as Lawesson's reagent according to procedure of compounds **11a**.

The compounds of the present invention can be used in the form of salts derived from pharmaceutically or physiologically acceptable acids or bases. These salts include, but are not limited to, the following salts with inorganic acids such as hydrochloric acid, sulfuric acid, nitric acid, phosphoric acid and, as the case may be, such organic acids as acetic acid, oxalic acid, succinic acid, and maleic acid. Other salts include salts with alkali metals or alkaline earth metals, such as sodium, potassium, calcium or magnesium in the form of esters, carbamates and other

conventional "pro-drug" forms, which, when administered in such form, convert to the active moiety in vivo.

This invention includes pharmaceutical compositions comprising one or more compounds of this invention, preferably in combination with one or more
5 pharmaceutically acceptable carriers and/or excipients. The invention also includes methods of contraception and methods of treating or preventing maladies associated with the progesterone receptor, the methods comprising administering to a mammal in need thereof a pharmaceutically effective amount of one or more compounds as described above wherein Q is oxygen as antagonists of the progesterone receptor. The
10 invention further provides comparable methods and compositions which utilize one or more compounds herein wherein Q is S, NR⁶, or CR⁷R⁸ as agonists of the progesterone receptor.

The progesterone receptor antagonists of this invention, used alone or in combination, can be utilized in methods of contraception and the treatment and/or
15 prevention of benign and malignant neoplastic disease. Specific uses of the compounds and pharmaceutical compositions of invention include the treatment and/or prevention of uterine myometrial fibroids, endometriosis, benign prostatic hypertrophy; carcinomas and adenocarcinomas of the endometrium, ovary, breast, colon, prostate, pituitary, meningioma and other hormone-dependent tumors. Additional uses of the
20 present progesterone receptor antagonists include the synchronization of the estrus in livestock.

When used in contraception the progesterone receptor antagonists of the current invention may be used either alone in a continuous administration of between
0.1 and 500 mg per day, or alternatively used in a different regimen which would entail
25 2-4 days of treatment with the progesterone receptor antagonist after 21 days of a progestin. In this regimen between 0.1 and 500 mg daily doses of the progestin (e.g. levonorgestrel, trimegestone, gestodene, norethistrone acetate, norgestimate or cyproterone acetate) would be followed by between 0.1 and 500 mg daily doses of the progesterone receptor antagonists of the current invention.

The progesterone receptor antagonists of this invention, used alone or in combination, can also be utilized in methods of treatment and/or prevention of benign and malignant neoplastic disease. Specific uses of the compounds and pharmaceutical compositions of invention include the treatment and/or prevention of uterine
5 myometrial fibroids, endometriosis, benign prostatic hypertrophy; carcinomas and adenocarcinomas of the endometrium, ovary, breast, colon, prostate, pituitary, meningioma and other hormone-dependent tumors. Additional uses of the present progesterone receptor antagonists include the synchronization of the estrus in livestock.

10 The progesterone receptor agonists of this invention, used alone or in combination, can be utilized in methods of contraception and the treatment and/or prevention of dysfunctional bleeding, uterine leiomyomata, endometriosis; polycystic ovary syndrome, carcinomas and adenocarcinomas of the endometrium, ovary, breast, colon, prostate. Additional uses of the invention include stimulation of food intake.

15 When used in contraception the progesterone receptor agonists of the current invention are preferably used in combination or sequentially with an estrogen agonist (e.g. ethinyl estradiol). The preferred dose of the progesterone receptor agonist is between 0.01 and 500 mg per day.

This invention also includes pharmaceutical compositions comprising one or
20 more compounds described herein, preferably in combination with one or more pharmaceutically acceptable carriers or excipients. When the compounds are employed for the above utilities, they may be combined with one or more pharmaceutically acceptable carriers or excipients, for example, solvents, diluents and the like, and may be administered orally in such forms as tablets, capsules, dispersible
25 powders, granules, or suspensions containing, for example, from about 0.05 to 5% of suspending agent, syrups containing, for example, from about 10 to 50% of sugar, and elixirs containing, for example, from about 20 to 50% ethanol, and the like, or parenterally in the form of sterile injectable solutions or suspensions containing from about 0.05 to 5% suspending agent in an isotonic medium. Such pharmaceutical

preparations may contain, for example, from about 25 to about 90% of the active ingredient in combination with the carrier, more usually between about 5% and 60% by weight.

The effective dosage of active ingredient employed may vary depending on the particular compound employed, the mode of administration and the severity of the condition being treated. However, in general, satisfactory results are obtained when the compounds of the invention are administered at a daily dosage of from about 0.5 to about 500 mg/kg of animal body weight, preferably given in divided doses two to four times a day, or in a sustained release form. For most large mammals, the total daily dosage is from about 1 to 100 mg, preferably from about 2 to 80 mg. Dosage forms suitable for internal use comprise from about 0.5 to 500 mg of the active compound in intimate admixture with a solid or liquid pharmaceutically acceptable carrier. This dosage regimen may be adjusted to provide the optimal therapeutic response. For example, several divided doses may be administered daily or the dose may be proportionally reduced as indicated by the exigencies of the therapeutic situation.

These active compounds may be administered orally as well as by intravenous, intramuscular, or subcutaneous routes. Solid carriers include starch, lactose, dicalcium phosphate, microcrystalline cellulose, sucrose and kaolin, while liquid carriers include sterile water, polyethylene glycols, non-ionic surfactants and edible oils such as corn, peanut and sesame oils, as are appropriate to the nature of the active ingredient and the particular form of administration desired. Adjuvants customarily employed in the preparation of pharmaceutical compositions may be advantageously included, such as flavoring agents, coloring agents, preserving agents, and antioxidants, for example, vitamin E, ascorbic acid, BHT and BHA.

The preferred pharmaceutical compositions from the standpoint of ease of preparation and administration are solid compositions, particularly tablets and hard-filled or liquid-filled capsules. Oral administration of the compounds is preferred.

These active compounds may also be administered parenterally or intraperitoneally. Solutions or suspensions of these active compounds as a free base or

pharmacologically acceptable salt can be prepared in water suitably mixed with a surfactant such as hydroxypropylcellulose. Dispersions can also be prepared in glycerol, liquid, polyethylene glycols and mixtures thereof in oils. Under ordinary conditions of storage and use, these preparations contain a preservative to prevent the growth of microorganisms.

The pharmaceutical forms suitable for injectable use include sterile aqueous solutions or dispersions and sterile powders for the extemporaneous preparation of sterile injectable solutions or dispersions. In all cases, the form must be sterile and must be fluid to the extent that easy syringeability exists. It must be stable under conditions of manufacture and storage and must be preserved against the contaminating action of microorganisms such as bacterial and fungi. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol (e.g., glycerol, propylene glycol and liquid polyethylene glycol), suitable mixtures thereof, and vegetable oil.

The following non-limiting examples illustrate preparation and use of the compounds of the invention.

EXAMPLES

EXAMPLE 1

5-Bromo-2-oxo-2,3-dihydro-benzimidazole-1-carboxylic acid *tert*-butyl ester

Prepared via a literature procedure (*J. Org. Chem.* **60**(6), 1565-82 (1995)).

White solid: mp 148-149 °C; ¹H-NMR (DMSO-d₆) δ 11.4 (s, 1H), 7.6 (d, 1H, J = 8.57 Hz), 7.2 (dd, 1H, J = 8.57, 4.29 Hz), 7.1 (s, 1H), 1.6 (s, 9H); MS (ES) m/z 311([M-H]⁺, 70%), 313 ([M-H]⁺, 70%).

EXAMPLE 2

1-Benzyl-6-bromo-1,3-dihydro-benzimidazol-2-one

A mixture of 5-bromo-2-oxo-2,3-dihydro-benzimidazole-1-carboxylic acid
tert-butyl ester (2.5g, 8 mmol), benzyl bromide (1.2 mL, 10 mmol), potassium
5 carbonate (1.38g, 10 mmol), and potassium iodide (50 mg) in anhydrous acetonitrile
was heated at 80 °C under nitrogen for 1 hour. The reaction mixture was cooled to
room temperature and treated with a saturated aqueous ammonium chloride solution
(30 mL) and ethyl acetate (50 mL). The organic layer was separated and the aqueous
layer was extracted with ethyl acetate (3x30 mL). The combined organic layers were
10 washed with brine (30 mL) and dried (MgSO₄). After removal of the solvent, the
residue was taken up in trifluoroacetic acid (10 mL, neat) and the solution was stirred
at room temperature under nitrogen for 10 minutes. The reaction solution was then
treated with brine (30 mL) and ethyl acetate (50 mL). The organic layer was separated
and dried (MgSO₄). After removal of the solvent, the residue was applied to a pad of
15 silica gel to afford the title compound as white solid (1.89, 78%): mp 245-246 °C; ¹H-
NMR (DMSO-d₆) δ 11.2. (s, 1H), 7.37-7.27 (m, 6H), 7.13 (dd, 1H, *J* = 8.25, 2.25
Hz), 6.95 (d, 1H, *J* = 8.25 Hz), 5.0 (s, 2H); MS (ES) *m/z* 301([M - H]⁺, 50%), 303([M
- H]⁺, 50%).

5-Bromo-3-methyl-2-oxo-2, 3-dihydro-benzimidazole-1-carboxylic acid *tert*- butyl ester

A mixture of 5-bromo-2-oxo-2,3-dihydro-benzimidazole-1-carboxylic acid
tert-butyl ester (4.0 g, 12.8 mmol), iodomethane (2.74 g, 9.2 mmol), and K₂CO₃ in
25 CH₃CN (60 mL) was stirred at room temperature under a blanket of nitrogen
overnight. Upon completion of the reaction, ethyl acetate (200 mL) was added and
the organic layer was washed with H₂O (200 mL), dried over Na₂SO₄, and
concentrated. The residue was purified *via* chromatography (silica gel, 25% ethyl
acetate/hexane) to give 5-bromo-3-methyl-2-oxo-2,3-dihydro-benzimidazole-1-

carboxylic acid *tert*-butyl ester as a white solid: mp 98-99 °C; ¹H-NMR (CDCl₃) δ 7.7 (d, 1H, *J* = 8.5 Hz), 7.27 (bs, 2H), 7.09 (d, 1H, *J* = 2 Hz), 3.4 (s, 3H), 1.7 (s, 9H); MS (ES) *m/z* 349([M + Na]⁺, 20%), 351([M + Na]⁺, 20%); Anal. EXAMPLE 14

7-(3-Nitro-phenyl)-4H-benzo[1,4]thiazin-3-one

- A mixture of 2-amino-5-bromo-benzenethiol (20 g, 0.1 mol), ethyl bromoacetate (19 g, 0.1 mol), and sodium bicarbonate (8.8 g, 0.1 mol) in DMF (200 ml) was heated to reflux for 2 hours. The mixture was diluted with water and
15 extracted with ethyl acetate (2x100 mL). The combined organic extracts were washed with water, then brine, dried (MgSO₄) and evaporated to obtain the crude 7-bromo-4H-benzo[1,4]thiazin-3-one (20 g, 82%). A small portion of sample was recrystallized from ethanol to afford pure 7-bromo-4H-benzo[1,4]thiazin-3-one: mp 212 - 213 °C; MS (EI) *m/z* 243/245 (M⁺).
- 20 A solution of 7-bromo-4H-benzo[1,4]thiazin-3-one (2 g, 8.2 mmol), 3-nitrophenyl boronic acid (2.72 g, 16.4 mmol), potassium carbonate (6.85 g, 49.2 mmol), and tetrakis(triphenylphosphine) palladium(0) (0.95 g, 0.82 mmol) in dimethoxyethane (100 ml), ethanol (25 ml), and water (25 ml) was heated to reflux for 6 hours. After cooling to room temperature, the mixture was diluted with water and
25 extracted with EtOAc (3x50 mL). The combined organic extracts were washed with water, then brine, dried (MgSO₄) and evaporated to obtain crude 7-(3-nitro-phenyl)-4H-benzo[1,4]thiazin-3-one (0.15 g, 6%). Recrystallization of crude sample from EtOAc afforded the title compound: mp 290-292 °C; MS (EI) *m/z* 286 (M⁺).

2-Ethyl-7-(3-nitro-phenyl)-4H-benzo[1,4]thiazin-3-one

To a mixture of 2-amino-5-bromo-benzenethiol (20 g, 0.1 mol) and cesium carbonate (33 g, 0.1 mol) in DMF (500 ml) at -35 °C was added dropwise 2-bromobutyrylbromide (23 g, 0.1 mol). The mixture was allowed to warm to room temperature, poured into ice/water, and extracted with CH₂Cl₂ (2x50 mL). The combined organic extracts were washed with water, then brine, dried (MgSO₄) and evaporated. The residue was purified by column chromatography (SiO₂, ethyl acetate:hexane/1:6) to afford 7-bromo-2-ethyl-4H-benzo[1,4]thiazin-3-one (3.7 g, 14%): mp 100 °C; MS (EI) *m/z* 271/273 (M⁺).

A solution of 7-bromo-2-ethyl-4H-benzo[1,4]thiazin-3-one (2 g, 7.3 mmol), 3-nitrophenyl boronic acid (1.22 g, 7.3 mmol), potassium carbonate (3 g, 22 mmol), and tetrakis(triphenylphosphine)palladium(0) (0.84 g, 0.72 mmol) in dimethoxyethane (100 ml), ethanol (25 ml), and water (25 ml) was heated to reflux for 6 hours. After cooling to room temperature, the mixture was diluted with water and extracted with EtOAc (3x40 mL). The combined organic extracts were washed with water, then brine, dried (MgSO₄) and evaporated. The residue was recrystallized from ethanol to afford the title compound as tan crystals (0.17 g, 7.3%): mp 180 °C; MS (EI) *m/z* 314 (M⁺).

8-(3-Chloro-phenyl)-1,2,3,3a-tetrahydro-5H-pyrrolo[1,2- alquinoxalin-4-one

To a mixture of acetic acid (500 ml), 30% hydrogen peroxide (250 ml), and concentrated sulfuric acid (10 ml) was added 4-bromo-2-fluoroaniline (50 g, 0.26 mol) at 85 ± 5 °C over 20 minutes. The reaction mixture was allowed to cool to room temperature and filtered. The solution was diluted with water and extracted with EtOAc (2x100 mL). The combined organic extracts were washed with water, then brine, dried (MgSO₄) and evaporated. The semisolid residue was filtered and the

crude 4-bromo-2-fluoro-1-nitro-benzene was sublimed *in vacuo* to afford 4-bromo-2-fluoro-1-nitro-benzene (23 g, 40%): mp 82–83 °C; ¹H-NMR (DMSO-d₆) δ 7.64 – 7.70 (m, 1H), 8.0 (dd, 1H, *J* = 11.0, 1.98 Hz), 8.1 (t, 1H, *J* = 8.57 Hz); MS (EI) *m/z* 219/221 (M⁺).

- 5 A mixture of 4-bromo-2-fluoro-1-nitro-benzene (9 g, 40 mmol), L-proline (4.6g, 40 mmol), and potassium carbonate (7 g, 50 mmol) in ethanol (50 ml) and water (40 ml) was heated to reflux for 5 hours. After cooling to room temperature, the mixture was diluted with water and was adjusted to pH 6 with 1N aqueous HCl solution. The mixture was extracted with EtOAc (2x100 mL), the combined organic
10 extracts were washed with water, then brine, dried (MgSO₄) and evaporated to afford *N*-(5-bromo-2-nitro-phenyl)-pyrrolidine-2-carboxylic acid (6 g, 48%) which was used in the next step without further purification.

- A solution of *N*-(5-bromo-2-nitro-phenyl)-pyrrolidine-2-carboxylic acid (6g, 23 mmol) and tin(II) chloride dihydrate (16.5 g, 73 mmol) in ethanol (200 ml), water (30
15 ml) and concentrated HCl (10 ml) was heated to reflux for 6 hours. After cooling to room temperature, the mixture was diluted with water and was adjusted to pH 9 with 2N aqueous sodium hydroxide solution. After addition of EtOAc, the precipitated tin hydroxide was filtered off. The layers were separated and the organic layer was washed with water, then brine, dried (MgSO₄) and evaporated to afford 8-bromo-
20 1,2,3,3a-tetrahydro-5H-pyrrolo[1,2-a]quinoxalin-4-one (3.7 g, 60%), which was used without further purification.

- A solution of 8-bromo-1,2,3,3a-tetrahydro-5H-pyrrolo[1,2-a]quinoxalin-4-one (2.7 g, 10 mmol), 3-chlorophenyl boronic acid (1.6 g, 10 mmol), potassium carbonate (4 g, 30 mmol), and tetrakis(triphenylphosphine) palladium(0) (0.5 g, 0.43 mmol) in dimethoxyethane (100 ml), ethanol (25 ml), and water (25 ml) was heated to reflux for
25 6 hours. After cooling to room temperature, the mixture was diluted with water and extracted with EtOAc (3x60 mL). The combined organic extracts were washed with water, then brine, dried (MgSO₄) and evaporated. The crude product (1.5 g) was

recrystallized from EtOAc/hexane to afford the title compound (0.2 g, 7%); mp 210°C; MS (+APCI) m/z 299 ($[M+H]^+$).

1. T47D cell proliferation assay

The objective of this assay is the determination of progestational and antiprogestational potency by using a cell proliferation assay in T47D cells. A compound's effect on DNA synthesis in T47D cells is measured. The materials and methods used in this assay are as follows.

a. Growth medium: DMEM:F12 (1:1)

(GIBCO, BRL) supplemented with 10% (v/v) fetal bovine serum (not heat-inactivated), 100U/ml penicillin, 100mg/ml streptomycin, and 2 mM GlutaMax (GIBCO, BRL).

b. Treatment medium: Minimum Essential

Medium (MEM) (#51200-038 GIBCO, BRL) phenol red-free supplemented with 0.5% charcoal stripped fetal bovine serum, 100U/ml penicillin, 200 mg/ml streptomycin, and 2 mM GlutaMax (GIBCO, BRL).

c. Cell culture

Stock T47 D cells are maintained in growth medium. For BrdU incorporation assay, cells are plated in 96-well plates (Falcon, Becton Dickinson Labware) at 10,000 cells/well in growth medium. After overnight incubation, the medium is changed to treatment medium and cells are cultured for an additional 24 hr before treatment.

Stock compounds are dissolved in appropriate vehicle (100% ethanol or 50% ethanol/50% DMSO), subsequently diluted in treatment medium and added to the cells. Progestin and antiprogestin reference compounds are run in full dose-response curves. The final concentration of vehicle is 0.1%. In control wells, cells receive vehicle only. Antiprogestins are tested in the presence of 0.03 nM trimegestone, the reference progestin agonist. Twenty-four hours after treatment, the medium is discarded and cells are labeled with 10 mM BrdU (Amersham Life Science, Arlington Heights, IL) in treatment medium for 4 hr.

d. Cell Proliferation Assay

At the end of BrdU labeling, the medium is removed and BrdU incorporation is measured using a cell proliferation ELISA kit (#RPN 250, Amersham

Life Science) according to manufacturer's instructions. Briefly, cells are fixed in an ethanol containing fixative for 30 min, followed by incubation in a blocking buffer for 30 min to reduce background. Peroxidase-labeled anti-BrdU antibody is added to the wells and incubated for 60 min. The cells are rinsed three times with PBS and

- 5 incubated with 3,3',5,5'-tetramethylbenzidine (TMB) substrate for 10-20 min depending upon the potency of tested compounds. Then 25 μ l of 1 M sulfuric acid is added to each well to stop color reaction and optical density is read in a plate reader at 450 nm within 5 min.

e. Analysis of Results:

- 10 Square root-transformed data are used for analysis of variance and nonlinear dose response curve fitting for both agonist and antagonist modes. Huber weighting is used to downweight the effects of outliers. EC_{50} or IC_{50} values are calculated from the retransformed values. JMP software (SAS Institute, Inc.) is used for both one-way analysis of variance and non-linear dose response analyses in both single dose and dose
15 response studies.

f. Reference Compounds:

Trimegestone and medroxyprogesterone acetate (MPA) are reference progestins and RU486 is the reference antiprogesterin. All reference compounds are run in full dose-response curves and the EC_{50} or IC_{50} values are calculated.

2. Rat decidualization assay

The objective of this procedure is used to evaluate the effect of progestins and antiprogestins on rat uterine decidualization and compare the relative potencies of various test compounds. The materials and methods used in this assay are

30 as follows.

10091222.030102

a. Methods: Test compounds are dissolved in 100% ethanol and mixed with corn oil (vehicle). Stock solutions of the test compounds in oil (MazolaTM) are then prepared by heating (~80 °C) the mixture to evaporate ethanol. Test compounds are subsequently diluted with 100% corn oil or 10% ethanol in corn oil prior to the treatment of animals. No difference in decidual response was found when these two vehicles were compared.

b. Animals (RACUC protocol #5002)

Ovariectomized mature female Sprague-Dawley rats (~60-day old and 230g) are obtained from Taconic (Taconic Farms, NY) following surgery. Ovariectomy is performed at least 10 days prior to treatment to reduce circulating sex steroids. Animals are housed under 12 hr light/dark cycle and given standard rat chow and water *ad libitum*.

c. Treatment

Rats are weighed and randomly assigned to groups of 4 or 5 before treatment. Test compounds in 0.2 ml vehicle are administered by subcutaneous injection in the nape of the neck or by gavage using 0.5 ml. The animals are treated once daily for seven days. For testing antiprogestins, animals are given the test compounds and a EC50 dose of progesterone (5.6 mg/kg) during the first three days of treatment. Following decidual stimulation, animals continue to receive progesterone until necropsy four days later.

d. Dosing

Doses are prepared based upon mg/kg mean group body weight. In all studies, a control group receiving vehicle is included. Determination of dose-response curves is carried out using doses with half log increases (e.g. 0.1, 0.3, 1.0, 3.0 mg/kg...).

e. Decidual induction

Approximately 24 hr after the third injection, decidualization is induced in one of the uterine horns by scratching the antimesometrial luminal epithelium with a blunt 21 G needle. The contralateral horn is not scratched and serves

as an unstimulated control. Approximately 24 hr following the final treatment, rats are sacrificed by CO₂ asphyxiation and body weight measured. Uteri are removed and trimmed of fat. Decidualized (D-horn) and control (C-horn) uterine horns are weighed separately.

5

f. Analysis of Results:

The increase in weight of the decidualized uterine horn is calculated by D-horn/C-horn and logarithmic transformation is used to maximize normality and homogeneity of variance. The Huber M-estimator is used to down weight the outlying transformed observations for both dose-response curve fitting and one-way analysis of variance. JMP software (SAS Institute, Inc.) is used for both one-way ANOVA and non-linear dose-response analyses.

10

g. Reference Compounds:

All progestin reference compounds were run in full dose-response curves and the EC₅₀ for uterine wet weight were calculated.

3. PRE-luciferase assay in CV-1 cells

25 The object of this assay is to determine a compound's progesterational or antiprogesterational potency based on its effect on PRE-luciferase reporter activity in CV-1 cells co-transfected with human PR and PRE-luciferase plasmids. The materials methods used in the assay are as follows.

a. Growth medium: DMEM (BioWhittaker) containing 10% (v/v) fetal bovine serum (heat inactivated), 0.1 mM MEM non-

1009122:30402

essential amino acids, 100U/ml penicillin, 100mg/ml streptomycin, and 2 mM GlutaMax (GIBCO, BRL). Experimental medium: DMEM (BioWhittaker), phenol red-free, containing 10% (v/v) charcoal-stripped fetal bovine serum (heat-inactivated), 0.1 mM MEM non-essential amino acids, 100U/ml penicillin, 100mg/ml streptomycin, and 2 mM GlutaMax (GIBCO, BRL).

b. Cell culture, transfection, treatment, and luciferase assay

Stock CV-1 cells are maintained in growth medium. Co-transfection is done using 1.2×10^7 cells, 5 mg pLEM plasmid with hPR-B inserted at SphI and BamHI sites, 10 mg pGL3 plasmid with two PREs upstream of the luciferase sequence, and 50 mg sonicated calf thymus DNA as carrier DNA in 250 ml. Electroporation is carried out at 260 V and 1,000 mF in a Biorad Gene Pulser II. After electroporation, cells are resuspended in growth medium and plated in 96-well plate at 40,000 cells/well in 200 μ l. Following overnight incubation, the medium is changed to experimental medium. Cells are then treated with reference or test compounds in experimental medium. Compounds are tested for antiprogesterational activity in the presence of 3 nM progesterone. Twenty-four hr. after treatment, the medium is discarded, cells are washed three times with D-PBS (GIBCO, BRL). Fifty μ l of cell lysis buffer (Promega, Madison, WI) is added to each well and the plates are shaken for 15 min in a Titer Plate Shaker (Lab Line Instrument, Inc.). Luciferase activity is measured using luciferase reagents from Promega.

c. Analysis of Results:

Each treatment consists of at least 4 replicates. Log transformed data are used for analysis of variance and nonlinear dose response curve fitting for both agonist and antagonist modes. Huber weighting is used to downweight the effects of outliers. EC_{50} or IC_{50} values are calculated from the retransformed values. JMP software (SAS Institute, Inc.) is used for both one-way analysis of variance and non-linear response analyses.

d. Reference Compounds:

Progesterone and trimegestone are reference progestins and RU486 is the reference antiprogesterin. All reference compounds are run in full dose-response curves and the EC₅₀ or IC₅₀ values are calculated.

e. Analysis of Results: Analysis of dose-response data

For reference and test compounds, a dose response curve is generated for dose (X-axis) vs. the rate of enzyme reaction (slope) (Y-axis). Square root-transformed data are used for analysis of variance and nonlinear dose response curve fitting for both agonist and antagonist modes. Huber weighting is used to downweight the effects of outliers. EC_{50} or IC_{50} values are calculated from the retransformed values. After cooling to room temperature, the mixture was diluted with water, and acidified with 1N hydrochloric acid. The precipitate was collected on a funnel and dried to afford N-(5-bromo-2-nitrophenyl)-alanine (28.9 g, 100%). A sample was recrystallized from ethanol: m.p. 183-187 °C; ¹H-NMR (DMSO - d_6) δ 1.44 (d, $J = 6.9$ Hz, 3H), 4.56 (m, 1H), 6.87 (d, $J = 6$ Hz, 1H), 7.21 (d, $J = 1.7$ Hz, 1H), 7.99 (d, $J = 7$ Hz, 1H), 8.36 (d, $J = 7$ Hz, 1H), 13.27 (s, 1H).

25

To a solution of N-(5-bromo-2-nitrophenyl)-alanine (22 g, 76 mmol) in acetic acid (300 ml) was added iron powder (10 g, 180 mmol), and the mixture was stirred for 2 hours at 90 °C. The reaction mixture was cooled and filtered, and the acetic acid was evaporated. The remaining slurry was extracted with methylene chloride (3 x 200 ml). The combined extracts were combined, dried over magnesium sulfate, filtered,

and evaporated to afford 6-bromo-3-methyl-3,4-dihydro-1H-quinoxalin-2-one (9.4 g, 51 %). A sample was recrystallized from ethanol: m.p. 133-135 °C. ¹H-NMR (DMSO-d₆) δ 1.23 (d, *J* = 6.81 Hz, 3H), 3.80 (q, *J* = 6.81 Hz, 1H), 6.27 (bs, 1H), 6.63 (d, *J* = 8.35 Hz, 1H), 6.72 (dd, *J* = 8.35, 1.76 Hz, 1H), 6.80 (d, *J* = 1.76 Hz, 1H),

5 10.29 (s, 1H).

A solution of 6-bromo-3-methyl-3,4-dihydro-1H-quinoxalin-2-one (2.4 g, 10 mmol), 4-chlorophenyl boronic acid (1.6 g, 10 mmol), potassium carbonate (4 g, 30 mmol), and tetrakis-(triphenylphosphine)palladium (0) in dimethoxyethane (150 ml), ethanol (25 ml), and water (25 ml) was heated to reflux for 6 hours. After cooling

10 to room temperature the mixture was diluted with water, and extracted with ethyl acetate. The organic layer was separated, dried over magnesium sulfate, filtered, and concentrated to obtain crude product (0.83 g, 30 %). A sample was recrystallized from ethanol to afford the title compound: m.p. 228-230 °C. ¹H-NMR (DMSO-d₆) δ 1.28 (d, *J* = 6.63 Hz, 3H), 3.83 (q, *J* = 6.63 Hz, 1H), 6.16 (bs, 1H), 6.81 (d, *J* = 8.00 Hz, 1H), 6.91 (dd, *J* = 8.05, 1.9 Hz, 1H), 6.95 (d, *J* = 1.7 Hz, 1H), 7.46 (d, *J* = 8.6 Hz, 2H), 7.55 (d, *J* = 8.6 Hz, 2H), 10.32 (s, 1H); MS (EI) *m/z* 272/274.

EXAMPLE 28

4-Benzyl-6-(3-chlorophenyl)-3,4-dihydroquinoxalin-2(1H)-one

20 In a manner as described above, 4-bromo-2-fluoro-1-nitro-benzene (11 g, 50 mmol), and N-benzyl-glycine ethyl ester (10 g, 50 mmol) were reacted to give crude [(5-bromo-nitro-phenyl)-benzyl-amino]-acetic acid (10 g, 55 %). This product was reacted with iron powder to obtain crude 4-benzyl-6-bromo-3,4-dihydroquinoxalin-2(1H)-one (5 g, 58 %). A sample was recrystallized from ethyl acetate/hexane:

25 m.p. 174-176 °C. ¹H-NMR (DMSO-d₆) δ 3.75 (s, 2H), 4.43 (s, 2H), 6.71 (d, *J* = 1.9 Hz, 1H), 6.81 (m, 2H), 7.32 (m, 5H), 10.57 (s, 1H).

The title compound was prepared according to the procedure for Example 5 from 4-benzyl-6-bromo-3,4-dihydroquinoxalin-2(1H)-one (1.6 g, 5 mmol), and 3-chlorophenyl boronic acid (0.8 g, 5 mmol). An off-white powder (0.9 g, 51 %):

m.p. 182-185 °C ¹H-NMR (DMSO-d₆) δ 3.74 (s, 2H), 4.54 (s, 2H), 6.87 (d, *J* = 0.7 Hz), 7.0 (m, 2H), 7.36 (m, 8H), 7.52 (t, *J* = 1.8 Hz, 1H), 10.57 (s, 1H), MS (ESI) *m/z* 349 (M+H)⁺

EXAMPLE 29

Isopropyl 7-(3-chlorophenyl)-3-oxo-3,4-dihydroquinoxalin-1(2H)-carboxylate

To a solution of 7-bromo-3-oxo-3,4-dihydroquinoxaline (6.8 g, 30 mmol) in pyridine (50 ml) was added a solution of isopropyl chloroformate in toluene (35 ml, 1M, 35 mmol) over 30 minutes. The mixture was triturated with water/chloroform, the
10 organic layer was separated, washed with brine, dried over magnesium sulfate, and evaporated to obtain crude isopropyl 7-bromo-3-oxo-3,4-dihydroquinoxaline-1(2H)-carboxylate (9.3 g, 97 %). A sample was recrystallized from ethanol: m.p. 159-161 °C. ¹H-NMR (DMSO-d₆) δ 1.25 (d, *J* = 6.2 Hz, 6H), 4.25 (s, 2H), 4.90 (sep, *J* = 6.2 Hz, 1H), 6.89 (d, *J* = 8.6 Hz, 1H), 7.27 (dd, *J* = 9.1, 2.1 Hz, 1H), 7.74 (s, 1H), 12.51 (s,
15 1H), MS (ESI) *m/z* 330/332 (M+NH₄)⁺.

The title compound was prepared according to the procedure for Example 5 from isopropyl 7-bromo-3-oxo-3,4-dihydroquinoxaline-1(2H)-carboxylate (6.3 g, 20 mmol), and 3-chlorophenyl boronic acid (3.2 g, 20 mmol). Off-white crystals (3.7 g, 49 %): m.p. 174-176 °C. ¹H-NMR (DMSO-d₆) δ 1.27 (d, *J* = 6.4 Hz, 6H), 4.30 (s,
20 2H), 4.94 (sep, *J* = 6.2 Hz, 1H), 7.04 (d, *J* = 8.3 Hz, 1H), 7.50 (m, 4H), 7.61 (t, *J* = 1.9 Hz, 1H), 7.86 (s, 1H), 10.79 (s, 1H), MS (APCI) *m/z* 345/347 (M+H)⁺.

EXAMPLE 30

Isopropyl 7-(3-chlorophenyl)-3-thioxo-3,4-dihydroquinoxaline-1(2H)-carboxylate

25

Prepared according to the procedure for Example 24 from isopropyl 7-(3-chlorophenyl)-3-oxo-3,4-dihydroquinoxaline-1(2H)-carboxylate and Lawesson's reagent. A yellowish solid: m.p. 208-212 °C; ¹H-NMR (DMSO-d₆) δ 1.27 (d, *J* = 6.1

Hz, 6H), 4.62 (s, 2H), 4.94 (sep, $J = 6.1$ Hz, 1H), 7.23 (m, 4H), 7.64 (t, $J = 1.8$ Hz, 1H), 7.90 (s, 1H), 12.80 (s, 1H), MS (ESI) m/z 359/361 (M-H).
